

Data Migration Review & Optimization Services | GIS Project

Situation

Our Client, the largest provider of shared communications infrastructure in the US, selected a new software Geographic Information System (“GIS”) to house its physical assets (optical fiber, wireless cell towers, small cell wireless equipment) along with other geographic data. Migrating and optimizing the new system required significant data and analytical abilities.

Solution

SolomonEdwards selected and provided two resources to perform data migration review and optimization services for the new GIS. Subsequently, the consultants worked closely with management to revise and optimize the system to perform correctly, as well as provided user training.

Results

The Client was able to go live on the new system within deadline requirements, along with optimizing and standardizing system features. The work performed also allowed the Client to standardize its migration and loading processes and practices under its Fiber Management team.
